**FFT**  $\mathcal{O}(n \log(n))$ 

# MOD int, extended Euclidean Factsheet

## Combinatorics Cheat Sheet

### Useful formulas

$\binom{n}{k} = \frac{n!}{k!(n-k)!}$  — number of ways to choose  $k$  objects out of  $n$

$\binom{n+k-1}{k-1}$  — number of ways to choose  $k$  objects out of  $n$  with repetitions

$\left[ \begin{smallmatrix} n \\ m \end{smallmatrix} \right]$  — Stirling numbers of the first kind; number of permutations of  $n$  elements with  $k$  cycles

$$\left[ \begin{smallmatrix} n+1 \\ m \end{smallmatrix} \right] = n \left[ \begin{smallmatrix} n \\ m \end{smallmatrix} \right] + \left[ \begin{smallmatrix} n \\ m-1 \end{smallmatrix} \right]$$

$$(x)_n = x(x-1)\dots x - n + 1 = \sum_{k=0}^n (-1)^{n-k} \left[ \begin{smallmatrix} n \\ k \end{smallmatrix} \right] x^k$$

$\left\{ \begin{smallmatrix} n \\ m \end{smallmatrix} \right\}$  — Stirling numbers of the second kind; number of partitions of set  $1, \dots, n$  into  $k$  disjoint subsets.

$$\left\{ \begin{smallmatrix} n+1 \\ m \end{smallmatrix} \right\} = k \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} + \left\{ \begin{smallmatrix} n \\ k-1 \end{smallmatrix} \right\}$$

$$\sum_{k=0}^n \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} (x)_k = x^n$$

$C_n = \frac{1}{n+1} \binom{2n}{n}$  — Catalan numbers

$$C(x) = \frac{1-\sqrt{1-4x}}{2x}$$

### Binomial transform

If  $a_n = \sum_{k=0}^n \binom{n}{k} b_k$ , then  $b_n = \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} a_k$

- $a = (1, x, x^2, \dots)$ ,  $b = (1, (x+1), (x+1)^2, \dots)$
- $a_i = i^k$ ,  $b_i = \left\{ \begin{smallmatrix} n \\ i \end{smallmatrix} \right\} i!$

### Burnside's lemma

Let  $G$  be a group of *action* on set  $X$  (Ex.: cyclic shifts of array, rotations and symmetries of  $n \times n$  matrix, ...)

Call two objects  $x$  and  $y$  *equivalent* if there is an action  $f$  that transforms  $x$  to  $y$ :  $f(x) = y$ .

The number of equivalence classes then can be calculated as follows:  $C = \frac{1}{|G|} \sum_{f \in G} |X^f|$ , where  $X^f$  is the set of *fixed points* of  $f$ :  $X^f = \{x | f(x) = x\}$

### Generating functions

Ordinary generating function (o.g.f.) for sequence  $a_0, a_1, \dots, a_n, \dots$  is  $A(x) = \sum_{n=0}^{\infty} a_n x^n$

Exponential generating function (e.g.f.) for sequence  $a_0, a_1, \dots, a_n, \dots$  is  $A(x) = \sum_{n=0}^{\infty} a_n \frac{x^n}{n!}$

$$B(x) = A'(x), b_{n-1} = n \cdot a_n$$

$$c_n = \sum_{k=0}^n a_k b_{n-k} \text{ (o.g.f. convolution)}$$

$c_n = \sum_{k=0}^n \binom{n}{k} a_k b_{n-k}$  (e.g.f. convolution, compute with FFT using  $\widetilde{a}_n = \frac{a_n}{n!}$ )

### General linear recurrences

If  $a_n = \sum_{k=1}^n b_k a_{n-k}$ , then  $A(x) = \frac{a_0}{1-B(x)}$ . We also can compute all  $a_n$  with Divide-and-Conquer algorithm in  $O(n \log^2 n)$ .

### Inverse polynomial modulo $x^l$

Given  $A(x)$ , find  $B(x)$  such that  $A(x)B(x) = 1 + x^l \cdot Q(x)$  for some  $Q(x)$

1. Start with  $B_0(x) = \frac{1}{a_0}$
2. Double the length of  $B(x)$ :  
 $B_{k+1}(x) = (-B_k(x)^2 A(x) + 2B_k(x)) \bmod x^{2^{k+1}}$

### Fast subset convolution

Given array  $a_i$  of size  $2^k$ , calculate  $b_i = \sum_{j \& i=i} b_j$

```
for b = 0..k-1
    for i = 0..2^k-1
        if (i & (1 << b)) != 0:
            a[i + (1 << b)] += a[i]
```

### Hadamard transform

Treat array  $a$  of size  $2^k$  as  $k$ -dimensional array of size  $2 \times 2 \times \dots \times 2$ , calculate FFT of that array:

```
for b = 0..k-1
    for i = 0..2^k-1
        if (i & (1 << b)) != 0:
            u = a[i], v = a[i + (1 << b)]
            a[i] = u + v
            a[i + (1 << b)] = u - v
```

- **Fermat's little theorem.** Let  $p$  be prime. Then, for each integer  $a$ :

$$a^{p-1} \equiv 1 \pmod{p}.$$

Thus:

$$a^k \equiv a^k \pmod{(p-1)} \pmod{p}.$$

Also:

$$a^{p-2} \equiv a^{-1} \pmod{p}.$$

- **Iterating over subsets.** Let `mask` be the binary representation of a set. Then `for (int i = mask; i != 0; i = (i - 1) & mask)` will iterate over all the nonempty subsets of `mask`.

- **Chinese remainder theorem.** We know that:

$$\begin{aligned} x &\equiv a_1 \pmod{n_1} \\ x &\equiv a_2 \pmod{n_2} \end{aligned}$$

where  $n_1$  and  $n_2$  are (co)prime. We want to find  $a_{1,2}$  so that:

$$x \equiv a_{1,2} \pmod{n_1 \cdot n_2}.$$

A solution is given by:

$$a_{1,2} = a_1 m_2 n_2 + a_2 m_1 n_1,$$

where  $m_1$  and  $m_2$  are integers so that  $m_1 n_1 + m_2 n_2 = 1$ . Those values can be found using the Extended Euclidean algorithm.

- **Sum of harmonic series.**

$$\frac{1}{1} + \frac{1}{2} + \dots + \frac{1}{n} \in \mathcal{O}(\log n)$$

- **Number of primes below...**

$10^2$	25
$10^3$	168
$10^4$	1229
$10^5$	9592
$10^6$	78498
$10^7$	664579
